Jagdish Chaudhary

CTO · AI Solutions Architect · Technology & Engineering Leader

- Ahmedabad, India
- WhatsApp +91 96240 64090
- linkedin.com/in/jagdish-chaudhary

COMPETENCIES

Technology leadership

- Strategy and architecture
- Engineering team leadership
- Engineering standards
- Product and business alignment
- Estimation, budgeting and ROI
- Client discovery and consulting

AI solutions architecture

- Generative AI and LLM integration
- RAG and knowledge retrieval
- AI agents and tool workflows
- LLM and model selection
- Use-case assessment, roadmaps
- PoC and model evaluation

Engineering and infrastructure

- Enterprise architecture
- APIs and integrations
- Cloud deployment design
- DevOps, Docker and Kubernetes
- Security, scale and performance
- Access control and data privacy

TECHNOLOGY

LLM ECOSYSTEMS

OpenAI · Anthropic Claude · Google Gemini · Llama · Qwen

AI PATTERNS

RAG · AI agents · MCP · Tool calling · Document extraction · Forecasting

ENGINEERING

Laravel · PHP · Node.js · Python · REST APIs · SQL databases · Docker · Kubernetes · Cloud / VPS

PROFILE

Technology leader and AI Solutions Architect who turns business problems into working, production-grade software. I have led engineering teams of 25 to 50 people and owned technology strategy from the first discovery call through architecture, build and production deployment.

My hands-on focus is applied AI: LLM integration, RAG, AI agents, document extraction and workflow automation that connects to the ERP, CRM and internal systems a business already runs. I am as comfortable in a discovery workshop or an ROI discussion as in an architecture or infrastructure review.

Today I lead a development and delivery team building web, AI and automation projects for international clients across export, real estate, financial services, mobility, EdTech, events and SaaS.

25–50	8	5	7
engineers led across teams	industries delivered for	LLM families worked with	step method, discovery to support

WHAT I BRING TO YOUR PROJECT

01 **One accountable technical lead.** Discovery, architecture, delivery and production support stay with the same person instead of being passed between teams.

02 **AI that runs in production.** Document extraction, RAG, AI agents and forecasting are working inside a live enterprise ERP, not only in prototypes.

03 **Business-first scoping.** AI use cases are ranked by feasibility, data readiness, business value and expected ROI before any build starts.

04 **Secure, maintainable systems.** Access control, data privacy, human review of AI output, and an architecture your own team can own.

05 **Delivery capacity.** A development team behind the architecture, and experience leading engineering teams of 25 to 50 people.

EDUCATION

MC **Master of Computer**
Completed 2017

01 AI-Enabled Export ERP

IN PRODUCTION

Role: Architecture Lead, Technology Lead and AI Solution Designer

An export-focused ERP covering sales orders, customer management, export documentation, invoicing, inventory, shipment tracking, finance and reporting. I led the architecture and the engineering team, and designed how AI fits into daily export operations.

DOCUMENT INTELLIGENCE

- Extraction and generation for invoices, packing lists, purchase orders, transport documents and bills of lading.
- Structured field extraction, with outputs and summaries built from the extracted data.
- Validation rules and a human review step before data is committed.

KNOWLEDGE, AGENTS AND INSIGHT

- RAG over company documents and ERP knowledge, so staff ask questions in plain language.
- AI agents that carry out ERP workflow steps.
- AI-assisted reporting, data analysis and demand forecasting.

Laravel · LLM APIs · RAG · AI agents · Enterprise architecture

> **My contribution:** Owned architecture and integration design, led the engineering team, and worked hands-on on the AI architecture and LLM API integration.

02 RAG-Powered Real Estate Sales Assistant

Client: Real estate business, Dubai **Role:** AI Solution Architect and Integration Designer

THE PROBLEM

The sales team answered buyer questions by searching brochures, documents and FAQs by hand. Answers were slow and lead details were easy to lose.

THE SOLUTION

A RAG-based assistant that replaced the manual search and connected directly to the sales process and CRM.

WHAT IT DOES

- Retrieves answers from company documents, property brochures and FAQs.
- Responds in natural language and shows the source behind each answer.
- Handles customer enquiries and asks qualifying questions.
- Captures lead details in the CRM and hands qualified leads to sales.

RAG · LLM · CRM integration · Lead capture

> **My contribution:** Solution architecture and integration design, including the CRM connection and the sales handoff flow.

TECHNOLOGY LEADERSHIP PORTFOLIO

I run several client and product builds in parallel. On each one I own the architecture, set engineering standards, plan and assign work across the team, review delivery and manage the client from scope to launch.

EX Export and trade

Export ERP covering orders, documentation, inventory, shipments and finance, with AI document extraction and forecasting.

Led: Architecture, team leadership, AI integration

Laravel · LLM APIs · RAG

RE Real estate

RAG sales assistant answering buyer questions from brochures and FAQs, with lead capture into the CRM.

Led: Solution architecture, CRM integration

RAG · LLM · CRM

FS Financial services and trading

Trading analytics with strategy backtesting and entry and exit signals; ledgers and settlements built on immutable financial records.

Led: Architecture, data integrity rules, AI workflows

Node.js · Python · MCP

MO Transportation and mobility

Multi-tenant fleet and billing SaaS with driver portal, Android app, UPI payments, invoicing and settlement ledgers.

Led: Phased roadmap, API design, billing rules

Laravel · Vue 3 · React Native

ED EdTech

White-label mentorship portal for schools with 5 user roles and an assessment engine; AI assessment tools with generated reports.

Led: SRS/PRD, assessment design, integrations

Zoom · SendGrid · LLM APIs

EV Event management

Event registrations, workshop and retreat bookings, and attendee management workflows.

Led: Scope, solution design, delivery

Web platform · Payments · CMS

PT PropTech and community living

Society management SaaS: dues and levies, income and expense ledger, tenant KYC, facility booking and complaints.

Led: Module spec across 5 phases, financial controls

PostgreSQL · React · React Native

ST Sales and marketing tech

CRM with automated multi-mailbox email outreach, bounce and reply detection, a task engine and AI tool access.

Led: Architecture, task engine, email pipeline

Node.js · Prisma · PostgreSQL

HOW I LEAD TEAMS AND PROJECTS

Specs before code
Written SRS/PRD and fixed architecture rules before development starts.

Phased delivery
Large scopes split into phases that ship value early and fit the budget.

Engineering standards
Layered architecture, audit trails, automated tests and code review.

Data and money integrity
Tenant isolation, immutable financial records, gateway webhooks as truth.

AI-assisted engineering
AI coding tools with documented project rules for faster, consistent delivery.

Client ownership
Scope, estimates, budget negotiation and change requests handled directly.

Partner delivery
Partner agencies own strategy while my team owns technical execution.

Parallel portfolio
Several client and product builds run at once, each with a clear owner and plan.

03 MCP Server for Trading and Sales Workflows

Stack: Node.js, Model Context Protocol, AI client integrations

An MCP server that lets AI assistants act on real business tools instead of only answering questions. The same pattern lets a team use AI directly on its own CRM, ERP or internal systems.

TRADING WORKFLOWS

- Locate trading scripts and start backtests.
- Identify possible entry and exit points.
- Support trade entry and exit, with a human confirming each action.

SALES WORKFLOWS

- Research prospects.
- Prepare personalized outreach.
- Automate outreach workflow steps.

04 AI-Assisted DevOps Agent

IN DEVELOPMENT

Stack: Node.js, Python, VPS and Kubernetes environments

An agent that takes on repetitive infrastructure diagnostics so engineers spend less time on routine checks.

- Server health monitoring and log analysis.
- Security scanning and vulnerability detection.
- Docker and Kubernetes checks.
- Suggested remediation, applied only after human approval.

HOW I WORK WITH CLIENTS

1. **Discovery** — Business problem, current systems, bottlenecks
2. **Use-case assessment** — Ranked by feasibility, data, value and ROI
3. **Feasibility and cost** — Security, privacy, access, running costs
4. **Architecture** — RAG, models, integrations, cloud
5. **Proof of concept** — Real data, model evaluation, user validation
6. **Build and roll out** — Phased delivery, human review of AI
7. **Support and improve** — Accuracy, cost and performance after go-live

LEADERSHIP AND DELIVERY

- Led engineering teams of 25 to 50 people across different team and project structures.
- Owned architecture and technical strategy across software delivery initiatives.
- Set direction on cloud infrastructure, DevOps, security, scalability and performance.
- Combined hands-on technical work with team leadership and implementation oversight.
- Managed client discovery, solution consulting, estimation, budgeting and product decisions.
- Shared production operations with engineering and DevOps teams, owning architecture decisions and escalations.

> “ I build technology around the business need, not around the latest tool. Maintainable architecture, practical AI and secure integrations come first.
